TITLE: Transmission of TV by time compression of the video signal with
phase modulated pulses 4

SOURCE: Elektrosvyaz', no. 8, 1964, 38-43

TOPIC TAGS: television transmitter, television transmitting system, video
signal, phase modulation, phase modulated signal, television, transmission

Abstract: In the audio-video duplexing system proposed, the phase modulated pulses are inserted in the middle 4 microsec of the line blanking intervals, which normally have at least a 4.5 microsec duration. The noise, stability of the system is analyzed and tested experimentally with good agreement between the results. The method is recommended for closed circuit transmission with speech (not music). Further investigation is indicated for determining the possibility of time compressing the audio transmission on the picture carrier in the 10 to 15 ac range. The authors

PHYSICO-CHEMICAL PROPERTIES OF THE FLUORINE
COMPOUNDS OF TETRAVALENT URANIUM V. O.

Kolomo and M. L. Yashchenko. Translated from *Izvest.
Akad. Nauk S.S.S.R. Otdel. Khim. Nauk*, No. 2-3, 87-
87(1962). 17p. (AEC-4r-1959)

On the basis of a detailed study of the electrical conduc-
tivity and pH of solutions of fluorine compounds of tetra-
valent uranium of varying over-all composition in the
absence of oxygen in the air, it is concluded that in solution
all three fluorides of uranium containing different quantities
of chemically combined water yield one and the same
substance, to which the structure $(UF_4(OH)_2)_n$ is ascribed.
It is impossible to judge the structure of these compounds
when in solid form on the basis of their behavior when in
solution. Solutions of a compound whose over-all compo-
sition is $UF_4NH_4F \cdot \frac{1}{2} H_2O$ were subjected to similar
analysis, and it was shown that when in solution it decom-
poses into the compounds $(UF_4(OH)_2)_n$ and NH_4F , and it is
thus also impossible to judge its structure when in solid
form on the basis of data obtained. (auth)

TITLE:

Age Determination of Some Micas According to the Rubidium-Strontium Method (Opredeleniye vozrasta nekotorykh slyud po rubidiy-strontsiyevomu metodu)

PERIODICAL:

Geokhimiya, 1958, Nr 6, pp 535 - 544 (USSR)

ABSTRACT:

At the beginning of the present paper problems of the rubidium-strontium age determination are discussed. The determination of micas allows to control the obtained values by means of the potassium-argon method. Most of the 9 investigated samples come from the Kola peninsula. M. M. Yermolayev put them at the authors' disposal. They were not, as usual, decomposed with H_2F_2 and $HClO_4$ but according to Smith or in most cases according to Berzelius. Thus it was possible to avoid the formation of difficultly soluble potassium- and rubidiumdifluorides. For the determination of the ratio of isotopes the method of isotope dilution by means of Rb^{85} and Sr^{84} was chosen. The analysis was carried out by means of the mass spectrometer MC-35. The determinations lead to the following

Card 1/2

Age Determination of Some Micas According to
the Rubidium-Strontium Method

SOV/7-58-6-3/16

results: The age of the investigated pegmatite dikes of Kola is between 2 and $2.4 \cdot 10^8$ years. The results of Rb/Sr and K/Ar method agree best if the following constants are chosen: β -decay of Rb^{87} $1.39 \cdot 10^{-11} a^{-1}$; K-capture of K^{40} $5.5 \cdot 10^{-10} a^{-1}$. The deviation in two cases may be explained by recrystallization of micas. By the comparison of the two values it will perhaps be possible to determine the absolute age and the time of recrystallization. - Mica from pegmatite of Mamskiy rayon, Sibir' is far younger than it could be assumed from geological data. There are 6 tables and 34 references, 6 of which are Soviet.

"Experimental Use of Spreading Factor for Increasing the Immunogenic Action of the Calmette-Guerin Vaccine," M.V. Trius and T.N. Yashchenko, Cands of Med Sci, Div of Exptl Pathol, Moscow Oblast Sci-Res Tuberculosis Institute

Prob Tuberk, No 4, pp 13-19

Describes results of expts on mice. The addition of testicular extract [containing hyaluronidase] as a spreading factor to a virulent TB culture, aggravated the process of infection and produced a marked diffusion of bacilli through the organs of the exptl mice. The same process to a

27356

slightly lesser degree has been observed on addition of the spreading factor to virulent Koch bacilli killed by autoclaving. The injection of testicular extract to mice vaccinated with BCG did not produce a spreading effect, but rather impeded the diffusion.

✓ The mechanism of the action of certain factors upon the penetration of dissolved compounds through connective tissues. T. N. Yashchenko (Sci. Research Tuberc. Inst., Moscow Reg. 68-1-24-11-1001, *Microbiol., Epidemiol. i. Immunobiol.* 1954, No. 2, 65-8.—In a sterile saline ext. from rabbit testicles 0.75% trypan blue (I) was dissolved and this soln. was then injected into the backbone of active or dormant rabbits. The wool was shorn off and the penetration of the I was observed after 1, 2, 7, 14 and 48 hrs. by measuring the area dyed. The experiment was repeated with saline alone. It is concluded that the permeability is mostly regulated by the central nervous system. Synchronidase (II) plays only an immaterial role. The central nervous system activates II, or causes a protective inhibition of the penetrability of the connective tissues. This power of penetration is greater in the active animal than in the dormant one. W. J.
